### Information:

MOULD KING 11014S Motorised Roller Coaster is an impressive construction set with 3662 pieces, allowing you to build a large motorised roller coaster with a red track, white support structure, station and amusement park-inspired decorations. The model offers over 3 metres of track, a loop, turns, descents and a wagon lift mechanism, so once assembled it works like a miniature attraction. Its large dimensions of approx. 100,6 x 44,8 x 56,5 cm make it an eye-catching display piece for any collection. It is a great choice for fans of technical models, longer builds and constructions that combine movement with a decorative appearance.

### Full product description

### Expanded roller coaster made of bricks

MOULD KING 11014S Motorised Roller Coaster Model Building Set is an impressive construction set made up of 3662 pieces. The model lets you build a large roller coaster with a red track, a white support structure, a station and surrounding elements inspired by an amusement park. Once assembled, it creates a dynamic scene that looks great both while the mechanism is running and as a display piece in a collection. It is an option for people who enjoy longer building projects, technical details and models that offer movement once completed, not just a static appearance. Its large size, motorised drive and extensive track make it eye-catching at first glance.

## Motorised ride along the red track

The set has been equipped with a motorised lift for the cars, so the finished model can work like a miniature fairground attraction. The cars are pulled up to a higher level and then move along a route with bends, drops and a loop. This layout makes it possible to observe the construction in action and gives the model a more engaging character. The red track stands out clearly against the white supports, making it easy to follow the route from the station to the next sections of the ride. This solution will appeal to fans of technical bricks and to those who appreciate sets with moving functions.

## Loops, bends and the atmosphere of an amusement park

The coaster track is over 3 metres long, allowing for an extensive ride route with many sections. The structure includes a loop section, inclines, descents and parts that guide the cars through different areas of the model. As a result, the build is not just about assembling one simple structure, but involves many stages requiring concentration and logical connection of elements. The coaster station, surrounding details and distinctive supports help create the atmosphere of an attraction known from amusement parks. The finished model looks good from every angle, as the track, base and decorative elements form a coherent whole.

## Large structure on a green base

Once assembled, the model measures approx. 100.6 cm in length, 44.8 cm in width and 56.5 cm in height, so it requires suitable display space. The green base organises the whole structure and forms the foundation for the track, supports, station and scenic elements. A top view clearly shows how extensive the route is and how much space the individual sections of the coaster take up. This is a set where the building process can be just as interesting as the finished result, because each stage adds further functional sections of the track. Its large format means the model can become the centrepiece of a brick-built attraction collection.

## Impressive display even after dark

The MOULD KING 110145 roller coaster fits well into arrangements inspired by a night-time amusement park, where the track, station and tall structure can create a striking decorative feature. The red loops and white supports create a contrast that emphasises the shape of the entire coaster. The model can be placed on a shelf, a chest of drawers or in a specially prepared display area so that it looks like a miniature fairground attraction. The movement of the cars brings the structure to life and means it is not just a model to look at. It is a particularly interesting option for collectors looking for a large set with a clear theme and a mechanical function.

## Technical build for patient constructors

The number of pieces and the track layout make this set suitable for people who enjoy elaborate models and longer step-by-step builds. During construction, supports, the ride route, station elements, the lifting mechanism and surrounding decorations are created. Each of these parts plays a specific role in the finished structure, so building gives a sense of gradually creating a working object. The set helps you better understand how brick-built models can combine a stable structure with moving cars. Once completed, the model offers the satisfaction of a large build that can be started up and watched in action.

## Station, cars and surrounding details

The model is not limited to the track alone. The set also includes elements that build the atmosphere of an amusement park, including the coaster station, parts of the surroundings and two cars. As a result, the finished structure looks more complete and better reflects the character of an attraction where the ride begins at the platform. Scenic details make the model well suited to photography, display and combining with other sets with an urban or entertainment theme. It is an option for people who like a set to have not only a function, but also a strong visual presentation.

**Large moving model for your collection**

MOULD KING 11014S Motorised Roller Coaster Model Building Set is a set for fans of bricks, roller coasters and mechanical constructions. Once assembled, it offers a long track, a loop, motorised car lifting, two cars and an extensive amusement park scene. With dimensions of approx. 100.6 × 44.8 × 56.5 cm, the model stands out for its size and looks great as a standalone display piece. The set could be a great gift idea for someone who enjoys technical building and larger projects that require patience. It is a model that combines the building process, movement and decorative appearance in one structure.
