Full product description

GIGAETER DUO BOX 19 MMCX WIDEBAND

The **dual-polarized directional antenna** with a **gain of 19dBi**, with an integrated aluminum housing, allows **Routerboard Series 411, 433 and 711** devices to be mounted inside it. It is designed to set up dual links or 2x2 MIMO 802.11n standard over short distances. It has integrated pigtails terminated with an MMCX connector. The LAN port is led out with a waterproof hole, the diameter of which allows the insertion of an RJ45 plug without removing the housing. The antenna has a very wide operating range containing **from 4.9 to 6 GHz**.

Hermetic aluminum housing

The antenna's **state-of-the-art radiator array** is made using microstrip technology and is sandwiched between an aluminum screen and a shield made of highly durable and low attenuation ABS plastic. This protects the antenna from the effects of atmospheric conditions, protects the device from the effects of electromagnetic radiation from other devices, and guarantees durability and unchanging parameters during operation.
