Full product description

GigaSektor PRO 21/60 HV

Professional carrier-grade **sector antenna** with 21 dBi energy gain, using advanced solutions to enhance the performance of wireless networks. Reduced unwanted back radiation and low side lobes minimize the level of interference generated and received by the antenna from the environment, allowing it to be installed and operate efficiently in close proximity to other antennas.

Advantages of the antenna

The antenna can operate over a wide frequency range and the radiation pattern beams are stable as a function of frequency. This allows flexible and predictable operation and full use of the capabilities of the radio module connected to the antenna. **The dimensions and weight** of the antenna have been reduced and the available optional mounting brackets and weather-protected connectors allow the antenna to integrate directly with **Ubiquiti, Mikrotik and Cambium** devices. This allows for the convenient creation of compact and discreet base stations.

Comfortable design

The antenna was designed to achieve maximum production repeatability. The basic element of the antenna's radiators is a Teflon microwave laminate that maintains high stability of electrical parameters. It is sandwiched between an aluminum screen and a shield made of very durable and low-damping **UV-resistant** plastic. Thanks to such a robust design, the antenna can operate in harsh atmospheric conditions maintaining durability and unchanging parameters during operation.
