Price: **270.72 zł** gross / 220.10 zł net

Manufacturer: TELTONIKA

Referention number: DNXXGKMMNERMMKM

Information:

Teltonika TRM142 is an industrial 4G LTE modem with an RS232 interface, designed for stable communication in automation systems, IoT and remote monitoring. It enables easy connection of serial devices such as controllers and machines, without the need to replace the existing infrastructure. Thanks to LTE transmission, it provides reliable data transfer where there is no traditional network, and its metal housing and compact design are well suited to demanding industrial environments.

Full product description

Teltonika TRM142 - industrial 4G LTE modem

Teltonika TRM142 is an industrial 4G LTE modem designed for applications requiring stable cellular communication and integration with existing industrial systems. The device is equipped with an RS232 interface, which enables connection to devices using serial communication, such as industrial controllers, machines or automation systems.

LTE connectivity for industrial systems

The Teltonika TRM142 modem supports data transmission in 4G LTE networks, making it suitable for IoT applications, remote monitoring and industrial automation solutions. The device allows data to be transmitted over the cellular network in places where access to traditional network infrastructure is limited.

RS232 interface and easy integration

The built-in RS232 port enables communication with industrial devices using the serial transmission standard. The TRM142 is a good solution for modernising existing installations, allowing cellular connectivity to be used without the need to replace connected devices.

Compact industrial design

Teltonika TRM142 has a metal housing designed for operation in demanding industrial environments. The device's design allows it to be mounted in control cabinets and other installations where durability and convenient cable management are important.

Applications of Teltonika TRM142

The Teltonika TRM142 modem can be used in industrial IoT solutions, automation, monitoring systems and remote access to devices equipped with a serial port. The combination of LTE communication and the RS232 interface makes the device help integrate legacy installations with solutions based on data transmission over the cellular network.
