Full product description

MicroTik Audience LTE6 kit

MikroTik Audience LTE6 kit is a tri-band home access point, operating in three bands **2.4 GHz and high + low 5 GHz** with the ability to create a Mesh system mesh. LTE cat.6 kit is equipped with carrier aggregation function and allows the device to use multiple bands simultaneously.

A router with three radios

- 2.4 GHz (2x2 MIMO)
- 5 GHz (2x2 MIMO)
- 5 GHz (4x4 MIMO + MU-MIMO)

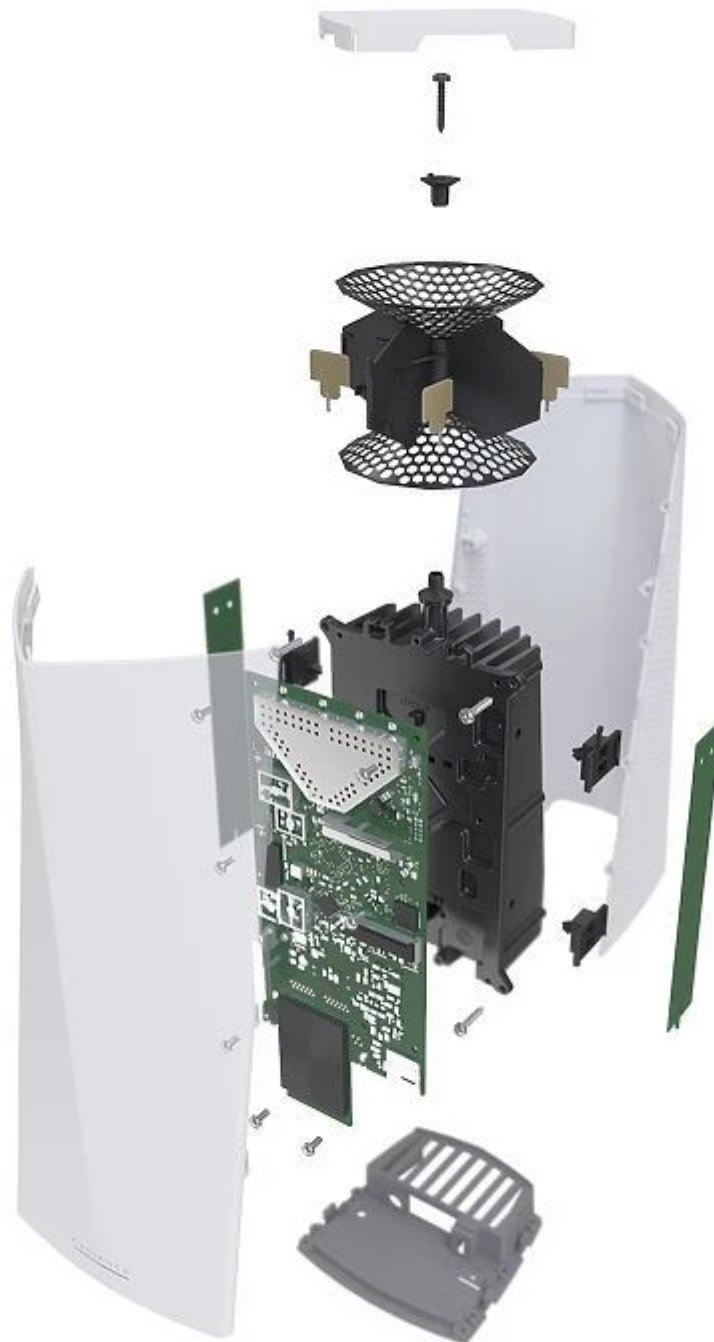

The size of the building is no longer a problem

If you need Wi-Fi in a huge building with all sorts of obstacles, simply add more Audience devices to your network - at the touch of a button they seamlessly sync and create a single Wi-Fi network covering the entire facility. Preconfiguration is also very simple - download the iOS or Android MikroTik app, it connects to your router and guides you through a quick setup process.

End of restrictions

The cables are no longer able to restrict you. CAT6 LTE provides speeds up to **300 Mb/s** with low latency, so having a traditional Ethernet connection is not necessary for streaming high-quality video or playing games. Alternatively, you can use two **Gigabit Ethernet** ports and keep the **LTE** option for backup. One of the Ethernet ports supports **PoE** to power the device. Dual-channel wireless **2.4GHz and 5GHz** wireless coverage will solve most interference problems in a crowded environment. For example, you can simultaneously use the **2.4 GHz** channel for all home mobile devices and reserve the **5 GHz** channel for your computer or TV.

The most important features:

- 2x Gigabit Ethernet ports
- 1x miniPCIe slot, 1x microSIM slot
- MU-MIMO technology
- Mesh Technology
- Support for 802.11 b/g/n/a/ac standards (wireless)
- PoE input
- Aggregation of bands
- LTE support cat.6
- Operation in 3 bands simultaneously (2.4 GHz and 2x 5 GHz)
- Low energy consumption

Fast and reliable in management

Wi-Fi must be fast, reliable and easy to manage. It must also reach every room and every nook and cranny. It is Audience devices that can provide WiFi even in the largest homes. **During official MikroTika tests**, in some cases, one Audience device was enough to replace several other routers without any problems, covering an area of **1858 m²**. The capabilities of the device depend on the number of obstacles, so results may vary.
