Full product description

Orvaldi INV12-840W Home

The **Orvaldi INV12-840W** home inverter is a line-interactive UPS based on full microprocessor control with pure sinusoidal output voltage waveform. The **ORVALDI** model - with a 20A charger output and the ability to charge batteries up to 200Ah - is a **very quiet unit** with fan-controlled operation and continuous high efficiency in the version with a single 12V DC battery.

Emergency power supply

INV - in UPS mode of operation is a sinusoidal transformation of 230V AC voltage, the main function of which is to work in the network and

uninterruptible switching to inverter operation after a power failure. The return of voltage automatically switches operation from inverter to grid operation and to automatic charging of the built-in **10 / 20A** battery. The inverter maintains any home appliances requiring continuous power supply, **ideal for heating appliances and other** loads requiring pure sine wave output and long backup time in case of emergency operation
