Full product description

Orvaldi NV24-1kW

Inverter (without batteries) working as a UPS in line-interactive topology, based on full microprocessor control with pure sine wave power supply provides a high degree of protection for connected devices. **INV - in the UPS function** are **230V AC** sine wave inverters with basic functionality for mains operation and uninterrupted transition to inverter operation after a mains outage.

When the supply voltage is restored, the inverter automatically returns to primary operation from the grid, and the internal charger charges the battery (up to 15 A). Maintain central heating stoves and other consumer pumps requiring emergency power in the form of a **pure sine wave** during very long emergency operations.

Features

- Full microprocessor-based power control
- Maintained small size with high output power
- Short switching time <10ms
- Pure sine wave output in battery mode,
- Auto-restart on return of supply voltage
- Charging batteries with the power supply off
- Cold start function allows the device to start without mains power
