Referention number: DNXGFNORIRMNGP

Full product description

UltraHorn™ TP - the ultimate in noise cancellation

UltraHorn TP series are high quality, scalar horn antennas. RF Elements products have all the advantages of scalar antennas, providing **ultrasonic noise attenuation, lossless radio connection and symmetrical beam without side loss**. Unique radiation properties make these **perfect antennas for long-range links in high noise** environments.

Precise targeting and zero loss

UltraHorn™ TP antennas are directional antennas, the signal **without any side loss** is focused on the main beam only. The precise radiation patterns of UltraHorn TP antennas allow you to create long-range links in noisy environments with unprecedented performance. The optimal beam width makes **focusing very easy compared to other point-to-point** antennas. UltraHorn™ TP antennas are equipped with our proprietary TwistPort connector, a patented waveguide port with a quick-lock function. The absence of coaxial RF connectors or RF cables makes the TwistPort virtually lossless. **The radio connection is brilliantly simple - "turn and lock". - you do everything with one hand.**

High gain of UltraHorn antennas

UltraHorn TP antennas have **a surprisingly high gain: 24 dBi for UH-TP-5-24**. Combined with narrow beam widths and no side loss **UltraHorn TP antennas deliver amazing performance**, even compared to competitor products with higher gain.
