Full product description

Ultradish TP400 antenna - four antennas in the set

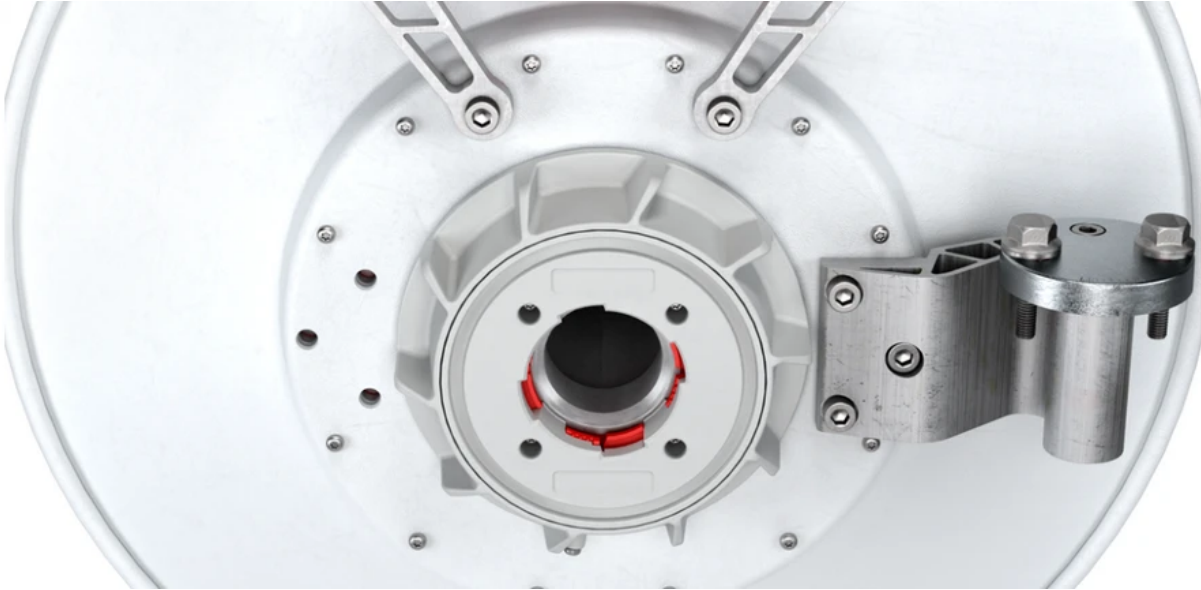

UltraDish™ TP 400 series antennas are designed for CPE or PtP connections. The antenna reflector is made of aluminum alloy to provide a very uniform antenna shape. The virtually lossless TwistPort connector guarantees easy radio deployment and maintenance. The antenna operates in 5GHz band frequency, antenna gain is 24dBi.

Simplicity of installation

Installation of the antenna is **extremely easy and ensures quick implementation for large radio projects**. The innovative RF Elements

antenna mount fits a wide range of pole diameters and can easily be converted to a right or left side mount. One Allen key is all it takes for quick installation. Four antennas are included.

TwistPort connector

The **TwistPort** connector is a fast blocking, virtually lossless waveguide port that connects the radio to the antenna. The TwistPort connector is a design by RF Elements and **sets a new standard for external wireless devices in terms of performance, scalability, ease of use and simplicity of implementation**. TwistPort is easy to install, thanks to the integration of mechanical connection and RF connector in the same structure, the connection between the radio and the antenna is extremely simple - "turn and lock" - you can do it with one hand! You no longer need to hold the antenna during installation.
