Full product description

Ultradish TP 550 antenna - set of four antennas

The **UltraDish** TP 550 series are parabolic directional antennas with double 2x2 MIMO polarity. The reflector is made of aluminum alloy, which ensures uniform shape of the antenna. Lossless TwistPort connector guarantees easy implementation and maintenance of the radio. The antenna operates in the **5 GHz** band and its gain is **27 dBi**.

Simplicity to ensure results

Installation of the antenna is **extremely easy**, which ensures quick implementation for large radio projects. Our innovative way of mounting the antenna, with left- and right-hand option, fits a wide range of pole diameters. For quick installation you only need one HEX tool.

TwistPort connector

The TwistPort connector is a fast closing and practically lossless waveguide port connecting radio and antenna. TwistPort is a project by RF Elements, which **sets a new standard for external wireless devices in terms of performance, scalability and ease of use.**

Innovative assembly

UltraDish TP series antennas guarantee **innovative mounting system**. The handle is separated from the antenna, so **installation** is not a problem, and **adjusting the antenna is easy, fast and pleasant.**
