Full product description

Tinycontrol Fluid Level Sensor CMW35-55-65-90

The float sensor is used in situations where there is a need to control the level of fluids in tanks. The use of two sensors - at the bottom and in the cover of the tank - will give us information when the liquid level reaches zero and when the tank is full. By connecting them to the electronic control system we can avoid situations when we run out of fluid or the tank is overfilled.

The sensor is made up of a float moving in accordance with the buoyancy force of the liquid along the tube causing the reed switch to engage or disengage.
