Full product description

Gigabit Smart Switch

TL-SL2210 is a **network switch** with 8 **Fast Ethernet 10/100Mbps** ports, 1 **10/100/1000Mbps** port and 1 **Gigabit SFP** slot. The hardware guarantees high data transfer performance, advanced QoS functionality and extensive second layer management features. TL-SL2210 is a cost-effective solution with useful security features for small and medium businesses. The **Storm control** function protects against the occurrence of **Broadcast**, **Multicast** and **Unicast** packets. The **QoS** (Quality of Service) function for layers 2 to 4 provides extended capabilities for optimizing data transmission. In addition, the ability to easily manage via a web browser, command line, and SNMP and RMON support allows quick configuration and reduced downtime. The TL-SG2210 is the ideal solution for workgroups and departments looking for cost-effective, fast edge switches.

Quality of Service function

To enable simultaneous smooth transmission of voice and video data, the switch is equipped with extended **QoS** functions. To ensure smooth data transmission, the administrator is able to prioritize data transmission based on port priority, **802.1P** and **DSCP** protocols. Additionally, the possibility of creating a voice**VLAN** ensures high performance of **VoIP** connections.

Configuration of layer two

To increase the number of possible applications, TL-SG2210 switches are equipped with a number of Layer 2 management features, including 802.1Q VLAN support, port isolation, port mirroring, STP/RSTP/MSTP, port aggregation and 802.3x flow control. Additionally, it is equipped with numerous maintenance functions such as loop back connection detection, cable diagnostics and IGMP snooping. IGMP snooping allows for intelligent multicast streaming to specific subscribers only, and IGMP throttling and IGMP filtering effectively restricts access to multicast for unauthorized users.

Management

The TL-SG2210 is easy to use and manage. It offers many user-friendly management options, such as an intuitive web-based graphical user interface (GUI) and a command line interface (CLI). Support for SNMP (v1/2/3) and RMON allows the device to send out unforeseen event messages and monitor device status.
