Full product description

Wireless router with WISP TL-WR843ND client function and speeds up to 300Mbps

TP-Link TL-WR843ND is a **wireless router** with AP and WISP client functions. It was developed especially for less demanding users who use wireless networks from Internet providers. With wireless connections up to **300Mbps**, it can handle applications such as HD video streaming. The device can also serve as a regular wireless router or access point. It also supports passive PoE power supply, which makes it easy to place the router in places where there are no power outlets, e.g. outside buildings.

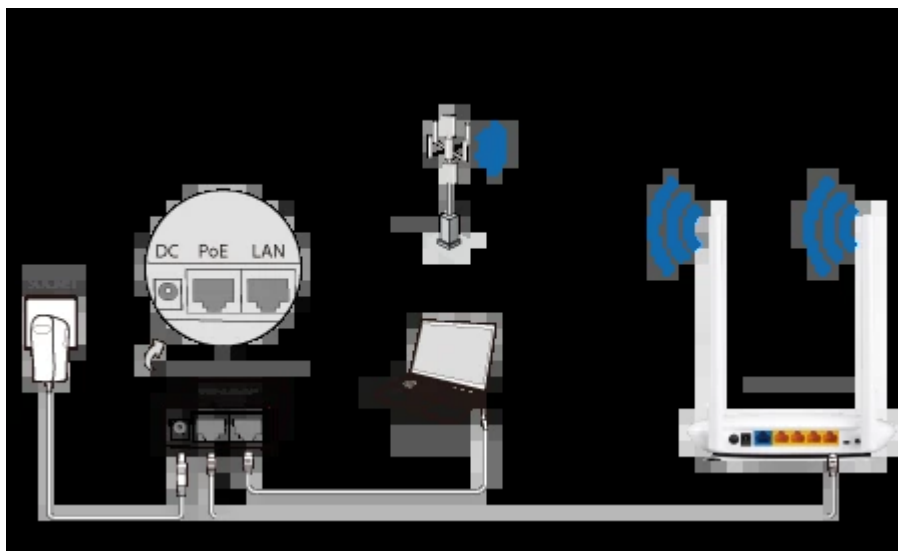

WISP client

The default operating mode of the TP-LINK TL-WR843ND device is **client-router**, enabling connection with the network of wireless Internet provider. In this mode the router can share Internet connection with computers in the local network - wirelessly or via Ethernet cable.

Large range

Thanks to **wireless connections in N** standard with speeds up to **300Mbps**, users can enjoy VoIP, HD streaming or online games without any interference. Thanks to the use of modern **N** technology, the router can also reduce the loss of data packets transmitted over long distances and over obstacles.

Passive PoE power supply

The **TL-WR843ND** device has a **RJ-45 WAN** port supporting passive **PoE** power supply. It is an ideal solution when it is necessary to install the device in places where the signal received from the wireless Internet provider is the strongest, but where there are no power outlets (e.g. in the attic or garage). The device provides the possibility of powering through PoE at a distance of up to 30 meters. Thanks to that it is possible to conveniently place the device in places previously inaccessible. The device also provides fast encryption of the wireless connection with **WPS** button.
