### Full product description

#### LTU-Rocket Access Point

**Ubiquiti LTU-ROCKET** is the first point-to-multipoint radio station in the LTU product family. The radio station operates in the 5GHz frequency band and has been specially designed for WISP wireless devices. The equipment, thanks to its unconventional design, allows for better performance in comparison with its predecessor airMAX. Using its advanced technology, the device has low delays and is able to work over long distances.

#### Flexible channel width

Channel width flexibility allows for TX and RX channel independence and frequency configurations anywhere in the radio band to avoid local interference. Channel width options include - 10 MHz - 20 MHz - 30 MHz - 40 MHz - 50 MHz - Up to 100 MHz\*

## Convenient configuration

LTU Rocket is managed in two ways: the configuration interface and the Ubiquiti network management system (UNMS™). Both options allow you to manually configure the radio station. In addition, the built-in GPS system improves synchronization of the device.

## Top performance

LTU is a new, proprietary technology with a custom silicone and radio design that breaks through the limitations of 802.11 Wi-Fi technology. As a result, LTU delivers significantly higher performance than previous AirMAX products based on 802.11 Wi-Fi. LTU Rocket from Ubiquiti Inc. is designed for WISP devices and its main communication processor provides low latency, long range, DFS flexibility, higher density, better output power and increased reception sensitivity.
