Full product description

Unlimited expansion possibilities

Ubiquiti mFi® management system is managed and monitored from the mFi controller software. The UniFi OS Console allows you to **create rules** that cause actions based on data from mFi sensors. For example, the light can be switched on when motion is detected, and the fan is switched on when a high temperature is detected. The mFi platform is compatible with devices from other manufacturers.

Ceiling-mounted motion detector

The mFi-MSC device is a dual-technology motion detector that uses both passive **infrared** and **microwave** motion detectors to minimize the likelihood of false alarms. It has handles to mount it on the wall. The sensor is designed for security, motion detection, controlling devies and other intelligent applications.

Simple configuration

Controlling devices and machines is extremely simple and is done by using **sensors** - depending on the schedule or conditions
