Full product description

Economical model with refreshed design

The Armac 650F/LED/V2 UPS from the Home Lite line is designed to meet the basic power autonomy requirements of home users using uninterruptible power supplies. The manufacturer has ensured high quality workmanship right from the production stage, which translates into the overall safety and reliability of this unit. The lack of communication connectors does not pose a problem for its functioning as an uninterruptible power supply for home electronics equipment.

HOME LITE SERIES

Emergency power system (UPS) - A safe choice for your home

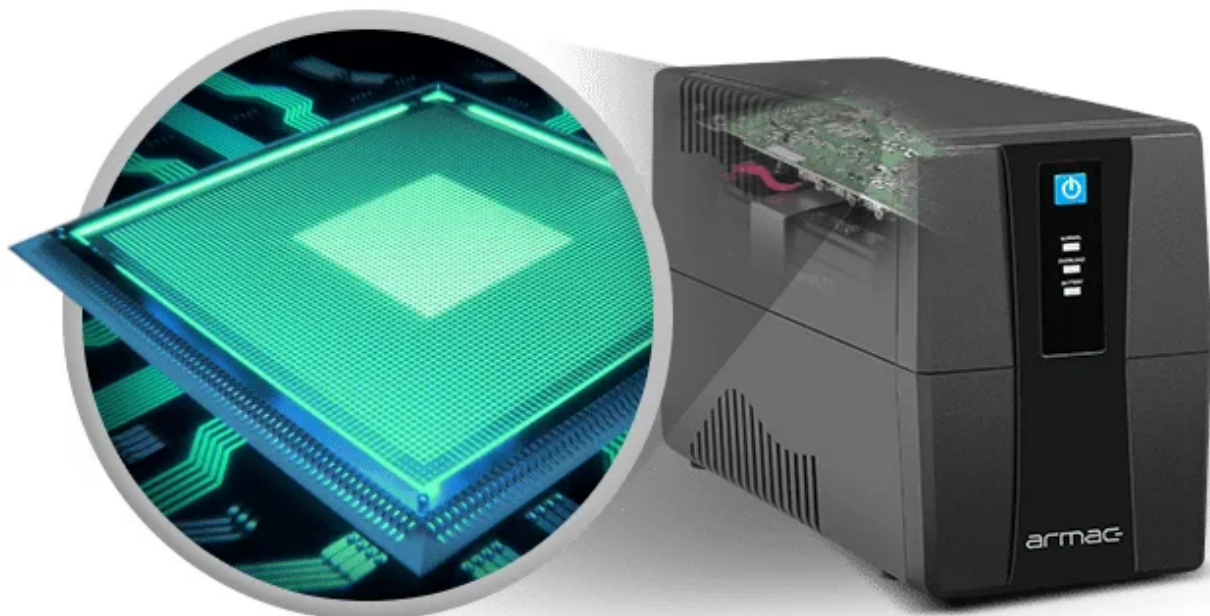

Armac UPS was created for all those who want to make sure their important devices will work even if power is lost. This includes:

1. TVs, PCs, gaming consoles, Smart Home devices
2. Chargers for phones, smartphones, notebooks, tablets
3. Switches, routers, repeaters, extenders, VoIP phones
4. Home speakers

Microprocessor control - high efficiency and monitoring of sensitive equipment

A dedicated processor is responsible for the proper functioning of the UPS, which monitors the parameters of the unit, its stable operation and the power supply to connected devices. The technology used in the UPS also allows automatic charging of batteries in Stand-By mode and automatic switching on when the mains power returns.

High level of security

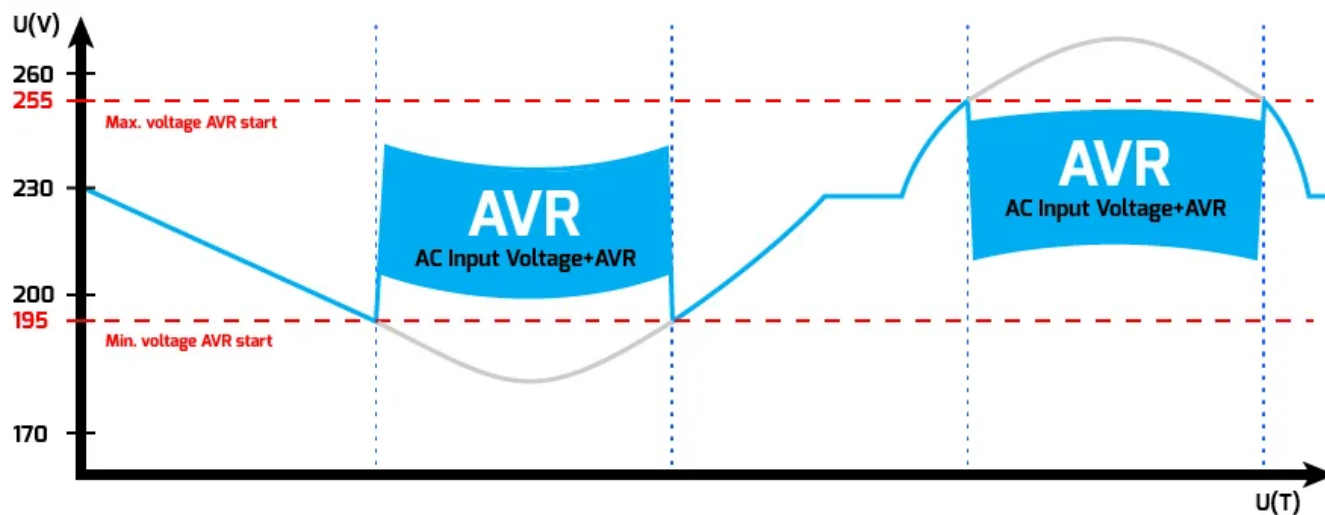

Armac UPS from the Home Lite line is the assurance of comprehensive protection for your electronic equipment. The solution not only guarantees reliability, but also provides comfort and peace of mind. With advanced features, the UPS provides protection against overload, short circuit, extreme temperatures inside the UPS and low/high battery voltage. You can trust the Armac brand and enjoy safety even during a sudden power failure.

Automatic voltage stabilizer - AVR

The AVR (Automatic Voltage Correction) function in the emergency power supplies automatically regulates low and high voltages from the outlet, adjusting them to safe levels to provide stable power for connected equipment. In this way, the feature protects equipment from short-term voltage dips and spikes that can cause damage.

5. When the voltage reaches about 255 V or more, the UPS will redirect the mains (AC) voltage to the autotransformer (AVR) so that the output voltage is within the acceptable range of 195 V to 255 V.
6. If the voltage drops to about 195 V or less, the UPS will divert the mains supply (AC) voltage to the autotransformer (AVR) to keep the output voltage within the acceptable range of 195 V to 255 V.

Discreet in operation - mute mode

For those who value peace and quiet, the noise made by devices signaling changes in their operation is undesirable. In the case of UPSs, battery mode operation often involves regular signaling sounds, which can be a nuisance, especially when the UPS is placed near a TV, computer or desk. Armac cares about the comfort of its users, which is why all UPS models have a feature of quiet operation in battery mode. This feature meets the expectations of even the most demanding users, who prefer quiet operation of the device regardless of its mode of operation.
