Advanced Banknote Authenticity Verification.

The EXTRALINK counter uses various technologies such as **UV** (ultraviolet rays), **MGF** (ferromagnetic detection head), and **IRA** (infrared checking) to effectively identify counterfeit banknotes. UV rays check the banknotes' paper and absorption layers, which minimizes the risk of accepting counterfeits. The MGF head detects special ferromagnetic properties for even more accurate authenticity assessment. These advanced technologies ensure complete security when counting cash.

Built-in Outdoor Display - Comfort and Transparency

The EXTRALINK counter comes with **an external display** that allows convenient tracking of counting results. This allows not only the operator, but also the customer to see in real time how many banknotes have been counted and what their value is. This is ideal for customer service points that require transparency and convenience. It increases the credibility of the operation and builds trust with customers.

Automatic Banknote Separation System

The EXTRALINK **banknote** counter is equipped with a **mechanical bill separation system** (SEP), which prevents errors associated with counting double bills. The ECR system further eliminates the risk of counting two bills as one, ensuring maximum precision. Automatic mechanisms, such as **IRB (bill thickness control)**, effectively detect stuck or double banknotes, so the counter not only speeds up operation, but also minimizes potential errors.
